

# WindSim Express Cloud

WindSim Express Cloud is an intuitive and easy to use wind farm design software. WindSim Express Cloud adds value to your projects whether you are a CFD beginner or a CFD expert. Learn more at:

**OUR KNOWLEDGE** ACCURATE SOLUTIONS

WindSim Express makes CFD based micro-siting a simple three step procedure. First, name your project. Second, load your turbine position and measurement data. Finally, set the resolution of the numerical model. That's all. WindSim Express automatically download a terrain model of the area of interest and runs the simulations.

The simulations can be run in two modes, in the Cloud or on a local machine. Access to powerful computing resources makes cloud simulations attractive. It is fast, cheap and easily accessible. Everyone can run cloud simulations on a pay per project basis. The project outcome is an Annual Energy Production report for your defined wind farm. WindSim licensee holders could alternatively run the simulations on their local machines. WindSim Express establishes an ordinary WindSim project that could be re-opened in WindSim, with the advanced properties available in the full version of the WindSim software.
